# Visual Assessment of Hepatic Fibrosis

XXVIII IFSO  
World Congress

9-12 September 2025  
Santiago, Chile

- A** – Visual: F0S0. Biopsy: F0S1.
- B** – Visual: F0S3. Biopsy : F1S1.
- C** – Visual: F3S2. Biopsy : F0S1.
- D** – Visual: F3S2. Biopsy : F4S1.

# Objectives

- Compare visual liver assessment with liver biopsy
- Evaluate correlation with CAP, FIB4 and VCTE

XXVIII IFSO  
World Congress

9-12 September 2025  
Santiago, Chile

# Study Design and Population

XXVIII IFSO  
World Congress

9-12 September 2025  
Santiago, Chile

- Type: Cross-sectional study
- Visual assessment: single expert surgeon (>5,000 BMS)
- Biopsy: left-lobe edge sample, Kleiner classification (gold standard)
- Additional analysis: correlation with CAP, FIB-4, VCTE
- Population: 310 consecutive patients (May–Nov 2024)
  - Inclusion: age 18–65, BMI  $\geq 35$  kg/m<sup>2</sup>, both sexes
  - Exclusion: other liver diseases, previous liver surgery

# Visual vs Biopsy in Steatosis

**XXVIII IFSO  
World Congress**  
9-12 September 2025  
Santiago, Chile

Metric	Value	Value (%)
Sensitivity	0.964	96.4%
Specificity	0.131	13.1%
PPV	0.819	81.9%
NPV	0.471	47.1%

[ifso2025.org](http://ifso2025.org)

# Visual vs Biopsy in Steatosis

XXVIII IFSO  
World Congress  
9-12 September 2025  
Santiago, Chile

Steatosis	Visual scale	Biopsy			
		Healthy	Mild	Moderate	Severe
Healthy		08	<b>50</b>	03	00
Mild		03	77	08	03
Moderate		05	69	20	06
Severe		01	23	23	11

# Visual vs Biopsy in Fibrosis

**XXVIII IFSO  
World Congress**  
9-12 September 2025  
Santiago, Chile

Metric	Value	Value (%)
Sensitivity	0.451	45.1%
Specificity	0.779	77.9%
PPV	0.695	69.5%
NPV	0.559	55.9%

# Visual vs Biopsy in Fibrosis

XXVIII IFSO  
World Congress  
9-12 September 2025  
Santiago, Chile

Fibrosis	Visual scale	Biopsy			
		Healthy	Mild	Moderate	Severe
Healthy		113	28	03	01
Mild		54	26	00	02
Moderate		<b>30</b>	<b>28</b>	03	02
Severe		5	10	02	<b>00</b>

# Visual vs Biopsy in Fibrosis

XXVIII IFSO  
World Congress

9-12 September 2025  
Santiago, Chile

- **Any fibrosis ( $F \geq 1$ ):**
  - Visual  $\approx$  VCTE ( $p = 0.694$ )
  - Visual  $\approx$  FIB-4 ( $p = 0.530$ )
- **Mild (F1–F2) vs. Advanced (F3–F4):**
  - Visual outperformed VCTE ( $p = 0.001$ )
  - Visual outperformed FIB-4 ( $p = 0.004$ )
- **VCTE, FIB-4 and Biopsy:**
  - VCTE significantly associated with histology ( $p < 0.001$ )
  - FIB-4 also associated ( $p = 0.030$ )

# Conclusions

- Visual inspection detects steatosis, but is not reliable for staging.
- Fibrosis is often misclassified visually, with risk of both under- and overestimation.
- Non-invasive tests (CAP, VCTE, FIB-4) show better correlation with histology, but remain limited in patients with obesity.
- Liver biopsy remains essential, and its indication should be defined preoperatively, not based on intraoperative appearance.
